My community has a couple problems that could be solved with technology. One problem that I would like to address is the litter of cans and plastic and glass bottles. It's a problem because such litter can lead to pollution hence leading to potential hazards. Hazards including health and environmental hazards. I and other members of my community would create an application that could potentially help reduce such litter by giving access to Bottle Recycling centers locations and statuses.

Application:

The application that we propose would be named "RecycleIt" and will follow the MVP solution. Our application will make use of HTML, CSS, JavaScript, MySQL, PHP, and more if need be. HTML and CSS will be used to format and style the web page, JavaScript and PHP will be used to add functionality, and MySQL will be used for the backend.

All in all, the application will be community driven. Communities are encouraged to collaborate and make the application even better. Members of the community would be able to add locations, review locations and could request new features. As the app ages, we plan to expand it into something bigger.
